## Objectives

## References

## Overall

This is a bi-weekly report documenting the Comp0016 project related activities and feedback from 31.12.2020 to 14.01.2021 The summary of our project including the progression we have made and remarkable issues in details.

The progress is we are starting to make algorithm on Azure machine learning studio by designer, and finish the frame of it, the next step is writing the R script of preprogressing data. Also, we are working on the Web UI making on power apps. Besides, we figure out how to deploy apps on different business and azure accounts.

## Achieved Goals

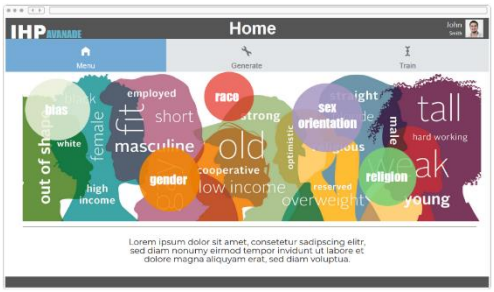
- Finished with the frame of the algorithm

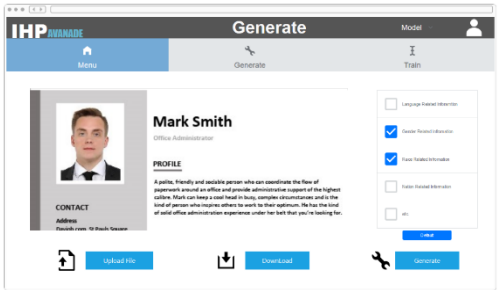
- Finished with the HCI report
- Finished with the prototyping
- Quickstart of PowerApps
- Quickstart of Flask, Bootstraps,HTML, CSS and JavaScript
- Understood how to use Azure and text analysis api

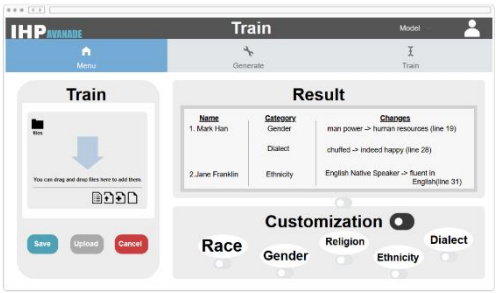
# Overall construction

The project is 40% completed.

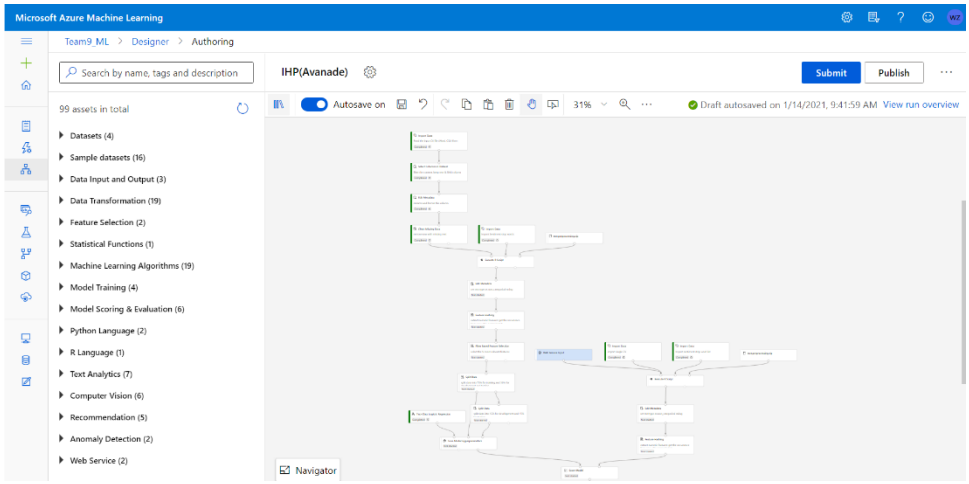
User interface

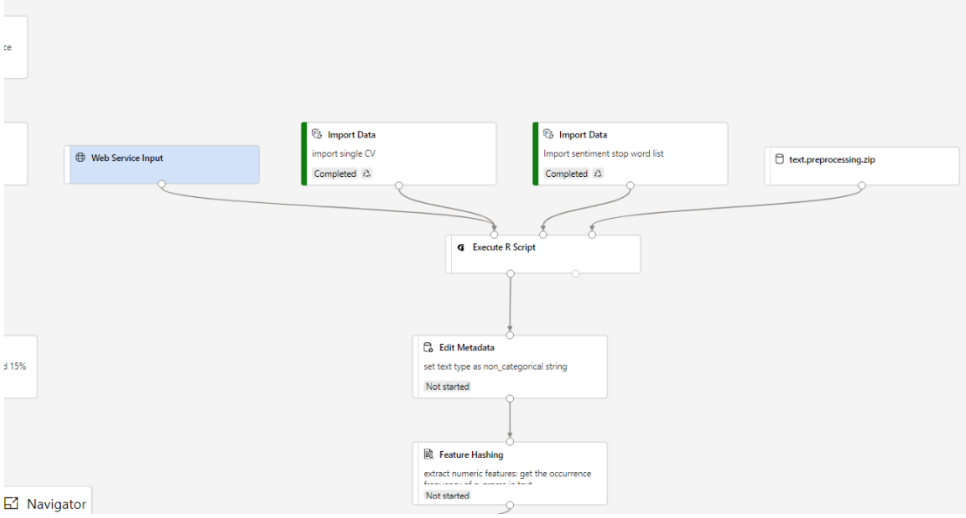






Screenshot of the User interface





Screen shot Of Machine learning

Key Issues

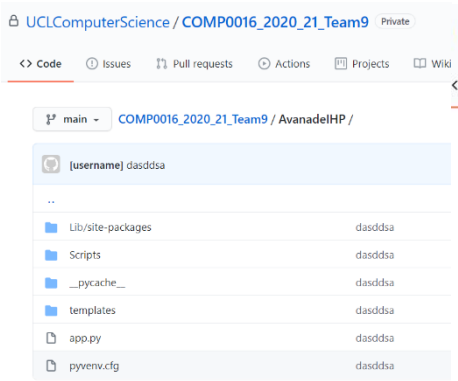
## Timeline

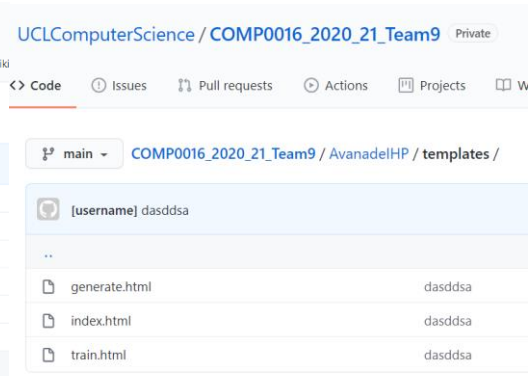
Before the reading week our team will finish the user interface and go into the testing and connecting between algorithm and UI

# Project Status

## Current situation

Our group has now completed the frame of the algorthm, working on the ui on on powerapps, figure out how to deploy apps on different business and azure accounts. next we are going to finish the R script in the algorithm part that preprogressing the text and the UI making. We are expected to give a highly finished algorithm and finished UI before the end of reading weekThe below pictures are the current progress we have done.





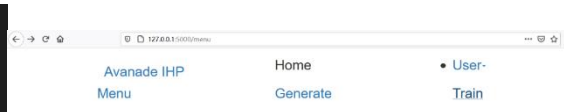
```python
from flask import Flask, render_template,redirect,url_for

app = Flask(__name__)
@app.route('/')
def menu():
    return redirect(url_for('index'))

@app.route('/menu')
def index():
    return render_template('index.html')

@app.route('/menu/train')
def train():
    return render_template('train.html')

@app.route('/menu/generate')
def generate():
    return render_template('generate.html')
```



## Moscow List

**Must have features (Features that we must put into our design):**

**Train:** Training function is the most core function for our project. The training is based on machine learning technique. It trains lots of data and distinguishes biased words. It is expected to distinct biased language that human cannot perceive consciously as well. After the detecting process, those words will be changed into neutral language.

**Personalized (customization training ）:** If a company demands to eliminate biased languages on particular field, the training can choose or focus on the field in order to reinforce the detection.

**Template upload training**

**Result display and tracing**

**Generate:** Generate function helps company users to get an unbiased CV. User need to upload original profile firstly and set training preferences to generate trained profiles. After processing, bias-free profiles can be downloaded from the page.

**Preference setting：** user can reserve specified contents, there are different types of key information to check.

**Should have features (Features we really want to keep in our design but deploying them may become a difficulty because of the implementation costs):**

**Bubble interactive UI(Menu):**
this function is to display some bias factor in the model we trained in the way of the floating bubbles, it allows users to have a certain degree of understanding and interaction, the user can click on the Bubble to check the sentence or information which led to the certain kinds of bias. This function is related to the data from the training part and it will be updated regularly within a certain period.

**Analysis & Suggestion for company: After applicants are hired to a company, their job performance can also be traced. Based on the traced performance data, the company can figure out which words were frequently used on well-performing worker's CV. It may be used on hiring people who are likely to work decently.**

## Objectives (Set goals)

Our future plans for the upcoming weeks are:

- Keeping out TAs updated with all tasks which we are carrying on
- Ask a question about UI programming to the client
- Subdivide web programming part into several parts and assign to each member
- Explore about power apps
- Study about ML algorithm
- Finish the design and coding of Menu
